

# DFH Liposomal Glutathione Stability Statement

---

Designs for Health, Australia do not recommend storing our Liposomal Glutathione 50 mL at room temperature for more than 10 days.

Glutathione is prone to oxidation that occurs much more rapidly at room temperatures, this does not impact therapeutic potency but will cause significant change to the taste and smell of the product.

The reason this product is stored refrigerated is to mitigate any sulfur taste/smell that might happen due to oxidation as mentioned above.

Official stability data shows that the potency of our Liposomal Glutathione remains intact for up to 6 months at room temperature, however, this does not mean the product should be stored at room temperature. To ensure the taste and smell remain stable, we do not recommend storing our Liposomal Glutathione at room temperature for more than 10 days.
